Today, [Texmaker](#) version 3.5 has been released. Texmaker is a free feature-rich Unicode capable LaTeX editor running on Linux, Mac OS X and Windows systems.

Enhancements in 3.5, from the ChangeLog file:

- It brings a new pdf viewer, based on qpdfview, with new modes "two pages", "discontinuous" and "presentation". Furthermore, pages can be rotated, and printing the pdf on windows doesn't use ghostscript anymore.
- There's a new command line option, so a command can be inserted by an external program to the current document.
- Polish quotes have been added.
- The structure items detection has been improved.
- The "Replace" dialog supports regular expressions for captured text.
- Texmaker now supports a high resolution screen on Mac OS X.

Besides those features, some bugs have been fixed.

The complete ChangeLog can be found [here](#) . Click [here](#) for downloading versions for Linux, Mac OS X or Windows or source files.
